

Uniformly paired states: stripe correlations versus pairing strength

24 paired MPSs: 22 square + 2 trellis. Cubic has no paired endpoints in this data set.

● $t_0 = 1$ ▲ $t_0 = 1.25$ ◆ $t_0 = 1.3$ ▼ $t_0 = 1.35$ + $t_0 = 1.4$ ○ Outer ring: accepted

Charge: $S_{n_+}^{\text{conn}}(q_c = \pi/8)$

Longitudinal spin: $S_{m_-}^{\text{conn}}(q_s = 15\pi/16)$

$$S_O^{\text{conn}}(q) = N_b^{-1} \sum_{ij} e^{iq(i-j)} [\langle O_i O_j \rangle - \langle O_i \rangle \langle O_j \rangle]; \text{ fixed stripe wavevectors, contact terms included.}$$

$n_+ = (n_0 + n_1)/2$, $m_- = (S_0^Z - S_1^Z)/2$; bulk rungs 9-56. Axis ranges differ by panel to show within-group variation.

16 unaccepted + 8 accepted MPSs. Equal-time intraladder correlations; parameter associations, not causal response functions.
