

Square (t_0, V) = (1.4, -0.4), $L=64$, $\chi=200$: energy from both 95%/5% seeds

$E_{\text{ref}} = -1.167404800838$ t/site (mean of both final 20 records). Iteration 1 is the first MF evaluation, not a separate seed energy.
Both endpoints remain unaccepted; these curves compare trajectories.
